GWT Bites the Dust in AERIUS After 16 Years

Last `GWT.create()` removed at 16:42 on a Thursday; CodeServer laid to rest with full honours. Team observes one minute of `mvn clean`.

BY OUR FRONTEND CORRESPONDENT · BILTHOVEN

It ended not with a bang but with a green build. At 16:42 on Thursday, a pull request titled simply *"AER-9998 - remove last gwt widget"* was merged into `main`, closing a chapter that began when smartphones still had keyboards and "the cloud" was something you checked before cycling to work.

"I typed `-Dgwt.skipCompilation=true` out of habit and it just... didn't matter anymore," said one developer, visibly moved. "Sixteen years of muscle memory. I don't know what to do with my hands."

The final compile reportedly took 11 minutes, which veterans described as "brisk" and "honestly a bit disappointing for a farewell." A small crowd gathered around the build monitor. Somebody brought cake. Nobody knew whether the cake was in scope.

The migration was carried out one component at a time — `FooComponent.java` and `FooComponent.html`, always in pairs, as tradition demands. The last holdout was a dialog nobody could open without first clicking three buttons in a specific order. "We found it by accident," a tester admitted. "Then we found a Cypress test that had been clicking those three buttons since 2023."

Asked about the generated `*Parser.java` files that appeared dirty after every stale `~/.m2` build, the team declined to comment, citing "trauma" and "a pending retro."

Not everything was thrown out. "We kept the code reviews, the AER tickets, the AGPL licence and the strict alphabetical sort of the message properties files," said a spokesperson. "Some things are bigger than any framework. `ApplicationMessagesTest` is one of them."

Continued on page 2: "Where were you when the CodeServer died?"

R.I.P.
CodeServer
2011 – 2027
"Failed. Try again."

The CodeServer, pictured in its final days, shortly after someone ran `mvn clean` without running `stop.sh` first.

BREAKING

QA GREEN for 3.65 Nights in a Row!

The nightly suite has passed for three full nights and roughly two-thirds of a fourth, when a single scenario timed out somewhere around minute 88. Engineers are treating the 0.65 as "statistically green."

"We're not saying it was flaky," said a tester. "We're saying it had a learning moment."

Devs Desperately Scraping Bottom of the Barrel of the TEL List

BY OUR BACKLOG DESK

For the first time in recorded history the TEL list has a visible bottom, and developers are now scraping it with spoons. Remaining items include "rename variable `tmp2`," "investigate why this works" and a ticket whose description reads, in full, "see conversation."

"We used to fight over who got the interesting refactors," one developer said. "Yesterday two people argued over a typo in a Javadoc." Product owners have been asked to "please, anything, even a dropdown."

Patrick Prepares for 7th Consecutive Week of Full-Time "Collaboration" With Auditor

BY OUR COMPLIANCE CORRESPONDENT

Patrick was seen on Monday sharpening pencils and printing the Statement of Applicability, now a respectable 93 rows. The auditor, who has their own mug in the coffee corner by now, is said to be "really very nice, actually."

"Week one was evidence," Patrick said. "Week four was evidence *of* the evidence. Now we just talk. Yesterday they asked how my weekend was, and I instinctively sent a screenshot of the access review."

CCOE ON TOP OF SECURITY!

★ DAILY PATCH MANAGEMENT TO PREVENT DATA LEAKS!
★ ALL DEPLOYS 100 % AUTOMATED!
★ ONLY REGULAR JANITORIAL WORK!
★ CLOUD INFRASTRUCTURE SOTA ON HYBRID CLOUD!

DAYS WITHOUT DATA BREACH
101

Paid advertisement. Counter maintained manually by a fully automated process. "Hybrid" refers to the cloud, not the counter.

Dependabot Files 41 PRs Before Breakfast; Team Merges 40

BY OUR SUPPLY CHAIN DESK

The daily patch ritual has become so routine that developers now merge Dependabot pull requests the way other people water plants. The 41st, a major version bump of a library nobody remembers adding, was put on hold "pending an adult in the room."

Since the CCoE introduced daily patching, the median age of a vulnerable dependency dropped from "a geological era" to under four days. A cheerful bot now posts the number to the team channel every morning, along with a weather forecast nobody asked for.

DPIA Completed: Only Personal Data Found Was a Cypress Fixture Named "Jan Jansen"

BY OUR PRIVACY CORRESPONDENT

After months of data-flow diagrams, the DPIA concluded that AERIUS mostly processes ammonia, which has no privacy rights. Investigators did trace one suspicious name to a test fixture created in 2019. Jan, a dairy farmer with 4,000 imaginary cows, has been anonymised to "J."

Log files were also checked. Apart from 14 million lines of `DEBUG` output, no email addresses were found, "which is a first."

Restore Test Succeeds; Team Recovers Calculation From 2019 Nobody Wanted Back

BY OUR OPERATIONS DESK

Under the new contract, backups must be proven by actually restoring them. The quarterly test was a full success. The restored GML file was opened, admired, and then deleted again under the retention policy, which the auditor called "a beautiful circle of life."

JobCleanup, the worker role that quietly deletes old jobs, was named Employee of the Quarter. It did not attend the ceremony, having already deleted the invitation.

HOW DO WE KNOW WE'RE SUCCESSFUL?

Nightly QA, green nights in a row	3.65 ▲
Lines of GWT remaining	0 ▼
Deploys done by hand	0 %
Days without data breach	101
New SonarQube violations vs main	0
Weeks Patrick spent with the auditor	7 ▲
Items left on the TEL list	"the bottom"
Times someone said "it worked on my CodeServer"	0 (RIP)
Jira ticket number	AER-9999
Regexes that break at AER-10000	3 (est.)

What Changed, What Stayed: A Team Portrait

SPECIAL REPORT · OUR REPORTER SPENT ONE SPRINT EMBEDDED WITH THE TEAM

What changed. Deploys are dull now, and that's the point. Every change goes from ticket to production through the pipeline, and the pipeline keeps the audit trail. Access gets reviewed every quarter, and that review is now a calendar event instead of an emergency. Security incidents, however small, go into a log with a cause and a fix. Security went from "someone should look at that" to a column on the board.

What we kept, deliberately. Code review on every change. Small PRs. Open-source code under the AGPL. The habit of asking "who uses this?" before building anything. And the long-standing tradition of losing a full afternoon to a property file that is one line out of alphabetical order.

What we had to change to get here. We wrote down things we had always done anyway, so we could prove them. We automated that proof wherever we could, because every hour spent keeping a spreadsheet by hand is an hour spent away from the barrel. We accepted that the auditor is part of the team now, at least on Tuesdays. And we said goodbye to GWT, which took longer than the contract, the audit and the DPIA put together.

What's next. Nobody knows. The TEL list is empty and the backlog is calm. Rumour has it that someone is drafting a ticket to "reconsider the build tool." The team has asked HR to make sure that person gets the support they need.

CLASSIFIEDS

FOR SALE: One CodeServer, lightly used. Crashes only after `mvn clean`. Sentimental value. Collection only, Bilthoven.

LOST: The flag `-Dgwt.skipCompilation=true`. Answers to "please." No longer needed but deeply missed.

WANTED: Anyone who remembers why the generated parsers are checked in. Reward: you get to explain it in a retro.

FREE TO A GOOD HOME: 93 controls, slightly applicable. Comes with a Statement of Applicability.

SEEKING: A product owner with a new feature request. Any size. Discretion guaranteed. Contact: the bottom of the barrel.

LETTERS TO THE EDITOR

Sir, — I write to complain that the nightly suite is now green so often that I no longer have a reason to open my laptop before coffee. What am I supposed to talk about at stand-up? — *A Tester, Utrecht*

Sir, — Regarding last week's piece "Hybrid Cloud: Both Clouds at Once." I wish to point out that it is, in fact, two clouds and a server under a desk, and that the desk has a name. — *An Ops Engineer, name withheld*

Sir, — Please stop printing the "days without data breach" counter. It is making the auditor nervous. — *Patrick*
